[Report a data error here](#)**Abstract of DE10107208**

An aerial (104) performs a vertical scan of the labels (103) of packages (102) on a palette (101) as the latter moves along. This provides vertical coordinates for the package positions, horizontal coordinates being derived based on the time a package takes to pass the aerial. A computer (107) controls and stores the coordinates. With stationary palettes the aerial scans the packages in x and y directions in a manner similar to that of a radar aerial.
